Committee:

### COMMENTARY

On Tuesday, May 6, 1986 at approximately 3:00 p.m., the No. 3 longwall section crew, under the supervision of William Wilson, Section Foreman, entered the mine, traveled by portal bus and arrived on the No. 3 longwall section at approximately 3:35 p.m. Wilson examined the working face before equipment was energized. Upon finding no abnormal conditions, Wilson then assigned the crew members their respective duties.

Work was started at approximately 4:15 p.m. to change a motor on the tailgate drive of the longwall. Normal mining operations were resumed at 4:55 p.m. and continued until 7:40 p.m. when the shear showed a ground in the power cable. Repair work was started immediately on the power cable to the longwall shear, located near the tailgate drive.

At approximately 9:00 p.m., Wilson traveled outby in the tailgate entry for a distance of approximately 60 feet to check a pneumatic water pump and observed no abnormal conditions. He then checked repair work on the shear and traveled to the headgate entry. At approximately 9:30 p.m., there was a loud noise and a tremendous amount of air and dust traveling from the tailgate to the headgate entry. The force knocked Lloyd Felts, Maintenance Supervisor, down causing injury to his shoulder.

Wilson and the crew left the section and arrived on the surface at approximately 10:00 p.m.

# DISCUSSION AND EVALUATION

- 1. The No. 3 longwall section is retreat type mining.
- 2. The No. 3 longwall section uses a single split type ventilation.
- 3. An on-shift examination of the area was conducted approximately 30 minutes preceeding the occurrence and no abnormal conditions were observed.
- 4. The area had previously been supported by regularly installed roof bolts and rib bolts. Supplementary support consisting of timbers and cribs had been installed through the affected area.
- 5. The coal which had become loose from the ribs was observed in the three entries along the tailgate of the No. 3 longwall for a distance of approximately 300 feet in each entry.
- 6. Four men were in the process of performing maintenance on the No. 3 longwall when they heard a loud noise and then experienced an onrush of air and dust from the return area. Lloyd Felts, Maintenance Supervisor, suffered a broken collarbone as a result of being knocked down.
- 7. Several of the workmen along the longwall and in the headgate area were blown down from the concussion created from the coal outburst.
- 8. Vibrations were felt on the surface at the mine manager's office, a distance of approximately 5,000 feet along the surface.

9. The No. 3 and No. 4 mine fans, which are located on the same return air shaft, are provided with a monitoring system which shut the No. 3 mine fan off and gave an alarm due to the vibration.

## FINDING OF FACT

1. An investigation of the area was conducted revealing no violations of Title 30, CFR, Part 75 which would have contributed to the cause of the occurrence.

## CONCLUSION

The investigation of the area on the tailgate of the No. 3 longwall indicated that an outburst of coal had occurred involving approximately 12 pillars of coal.
